

CLIX: The Next Page

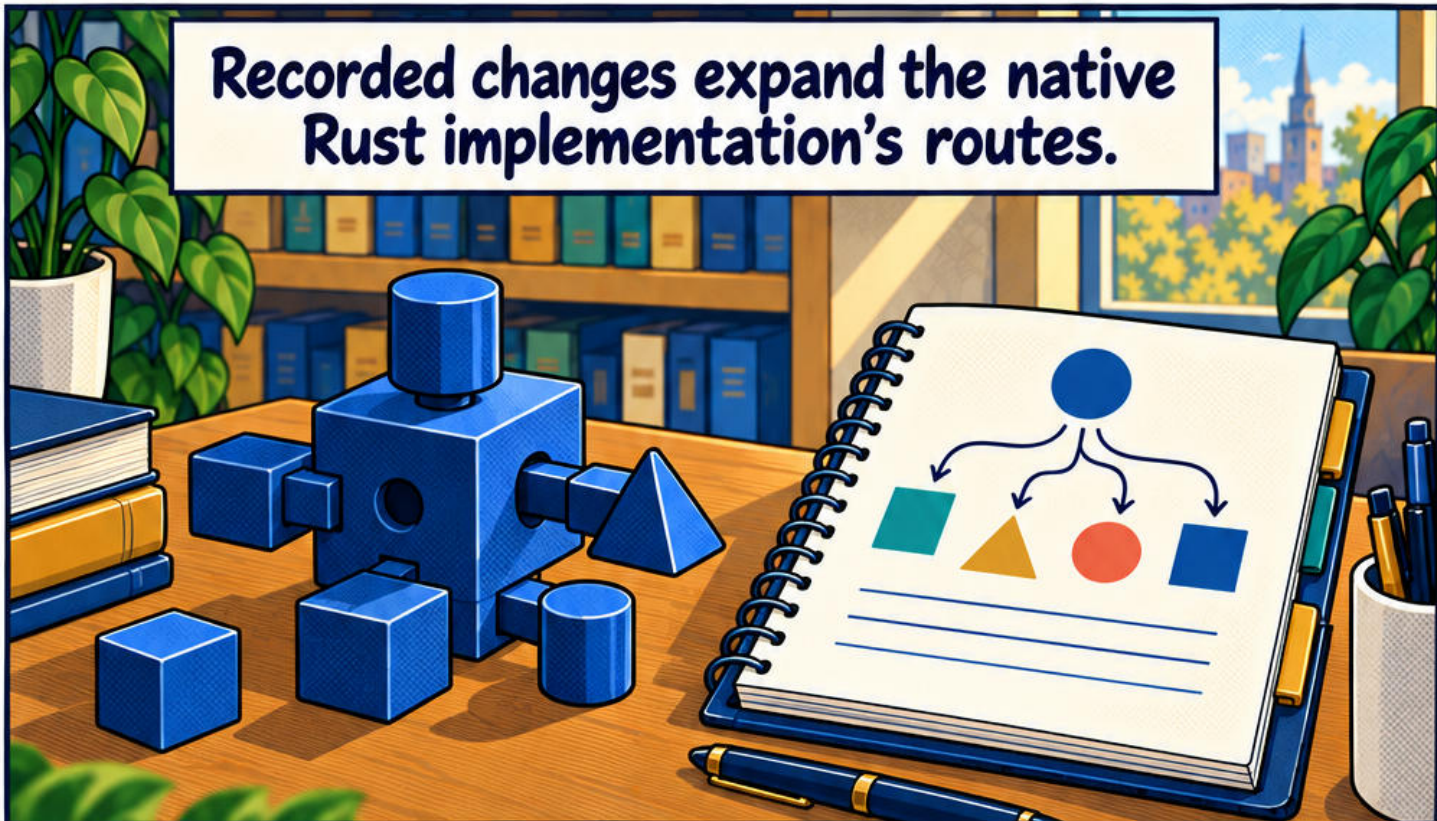

**A repair, a review, and the first pages
finding their public home.**

Routes before release

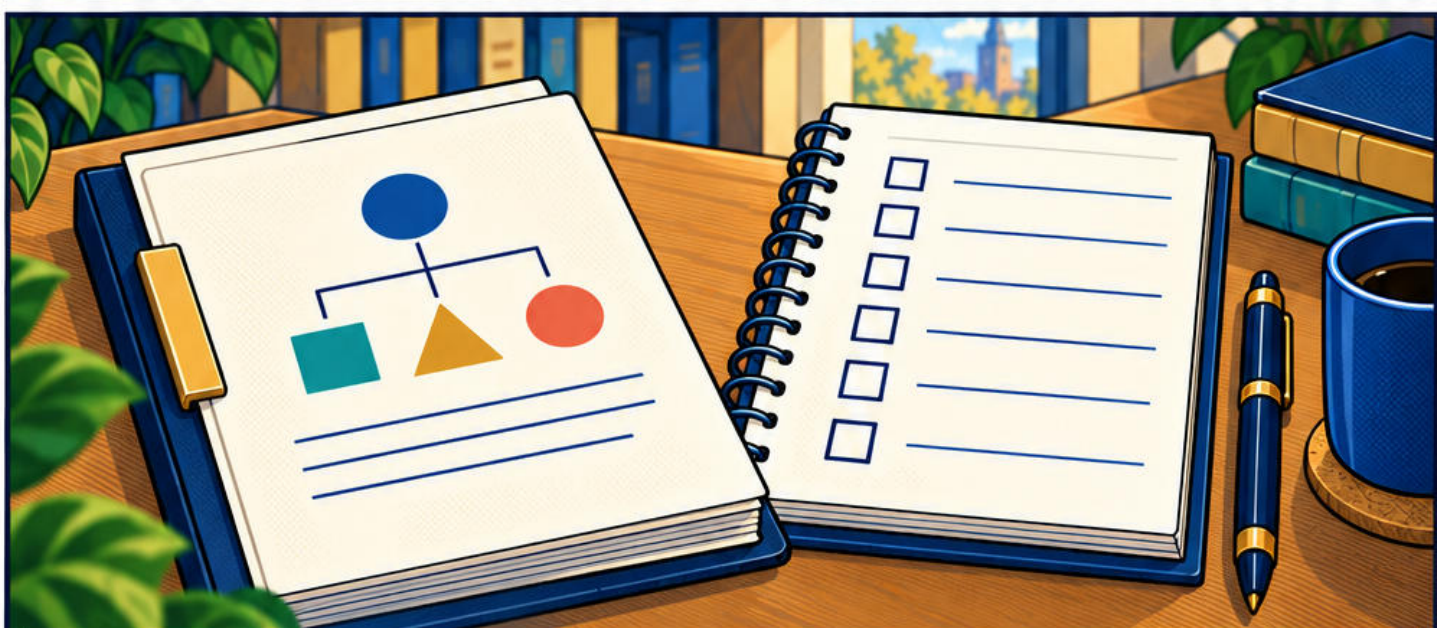

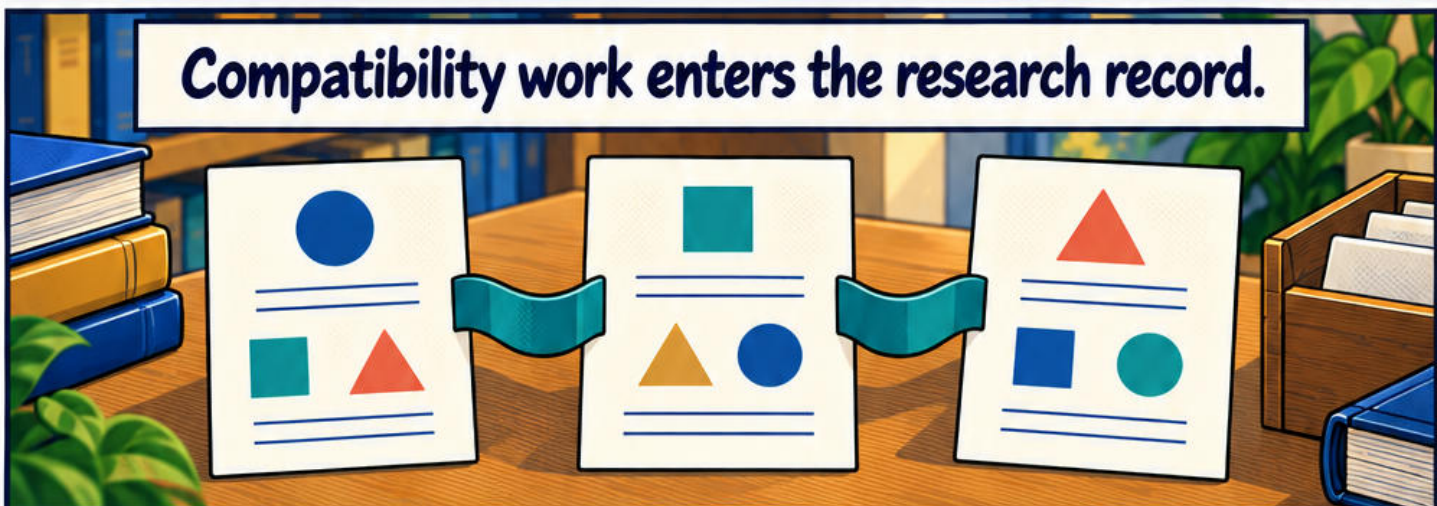

Recorded implementation work leads toward requirements that remain open.

Recorded changes expand the native Rust implementation's routes.

Compatibility work enters the research record.

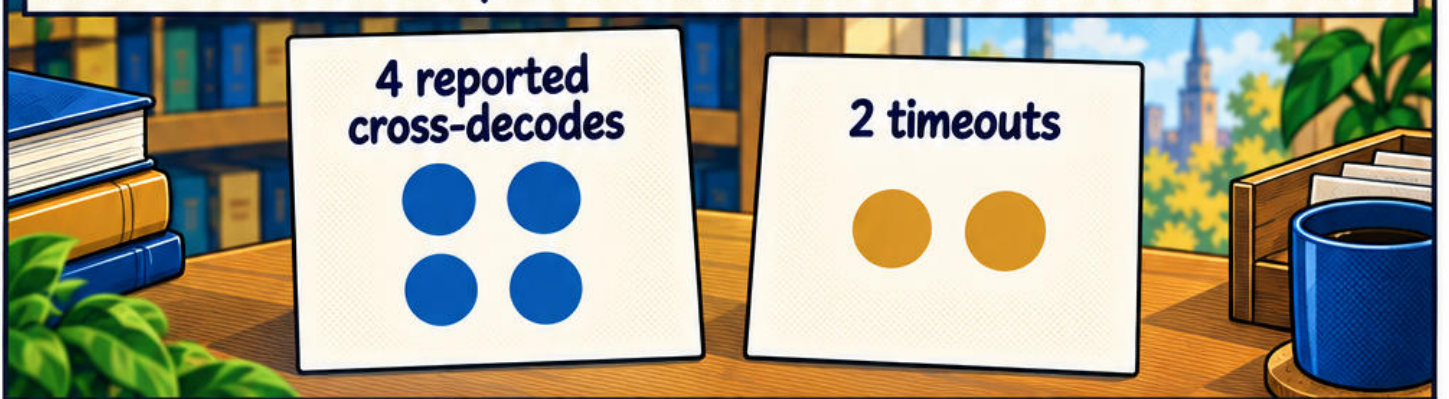

**These are recorded implementation milestones,
not a claim of release acceptance.**

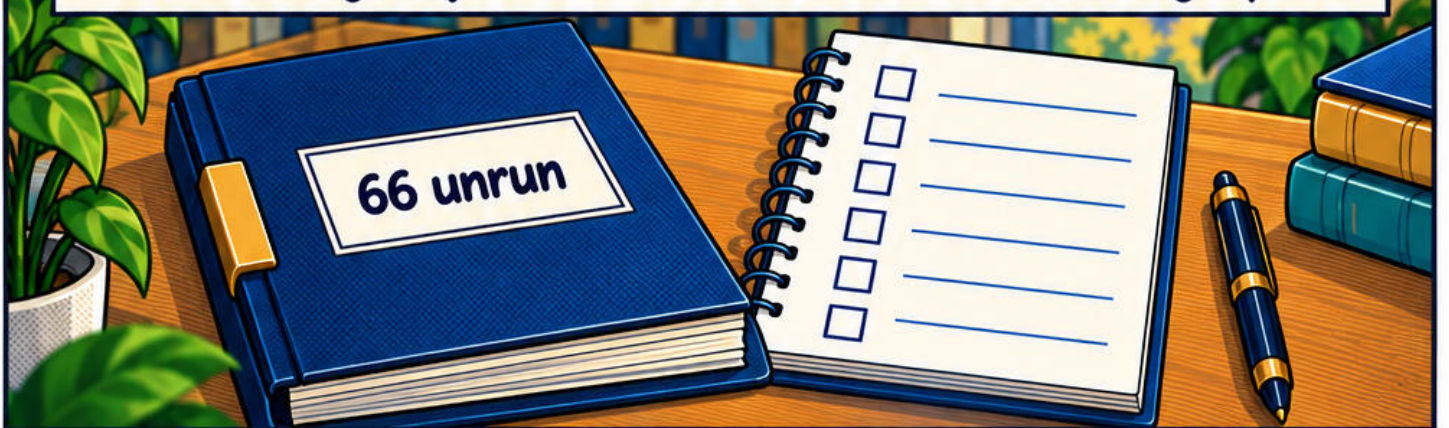

A merged integration milestone is recorded.

Its first six-cell screen reports four cross-decoded results and two timeouts.

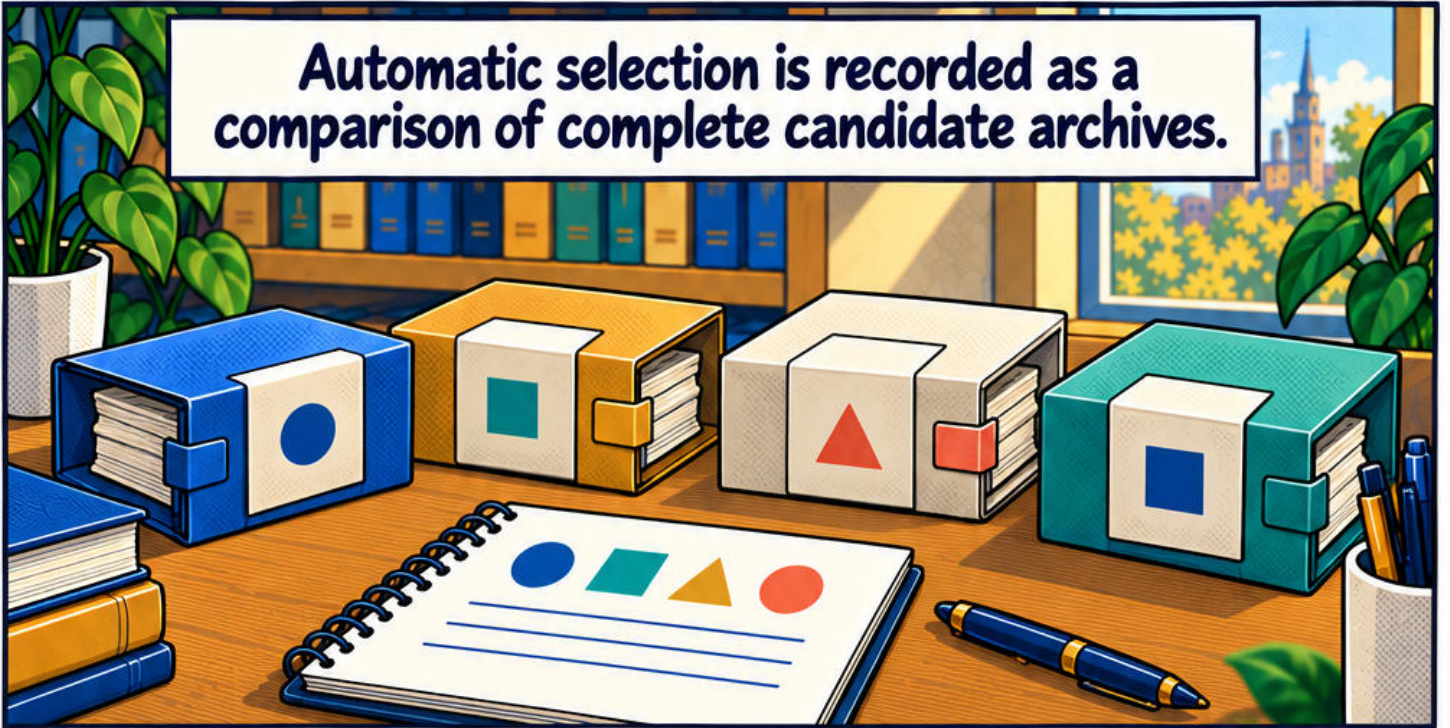

The remaining sixty-six cells were unrun in that screening report.

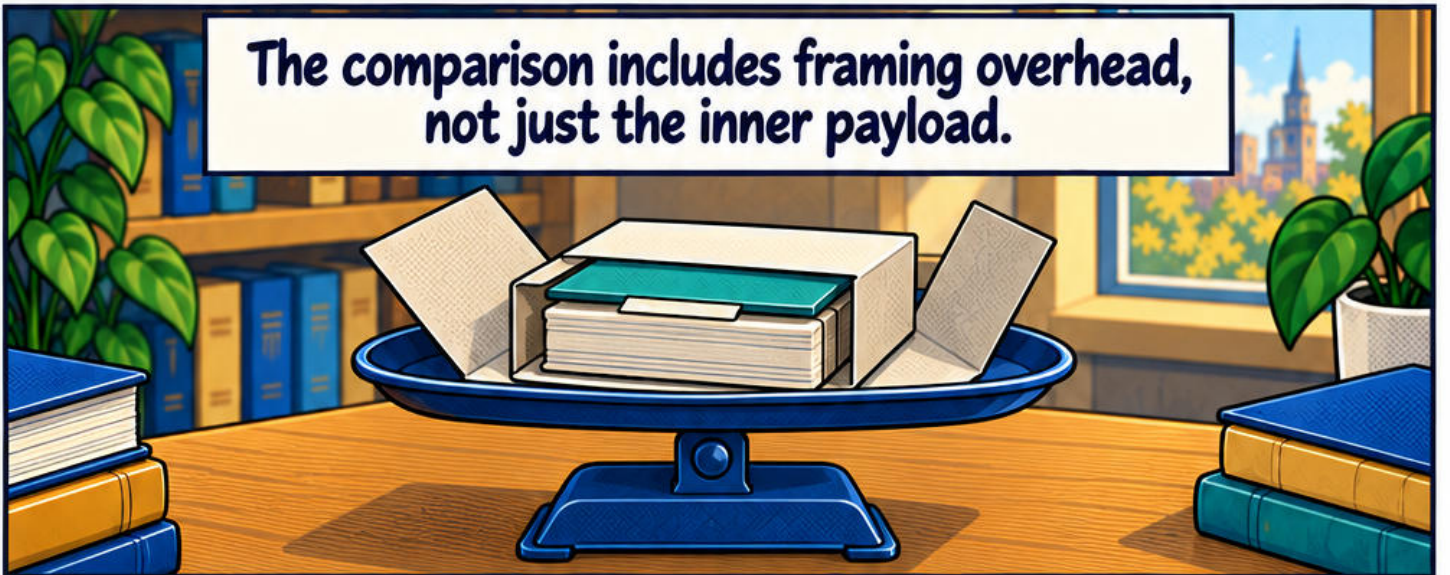

This is author-reported screening. A merge is not release acceptance.

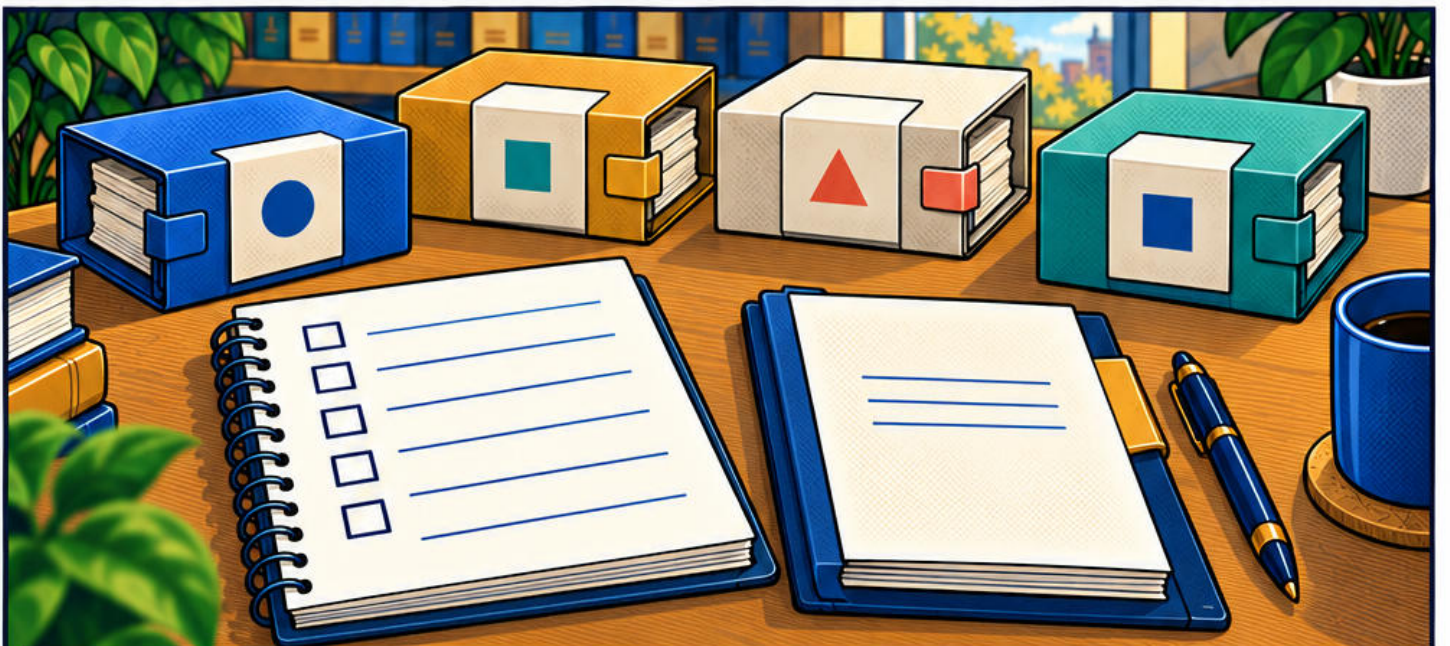

Automatic selection is recorded as a comparison of complete candidate archives.

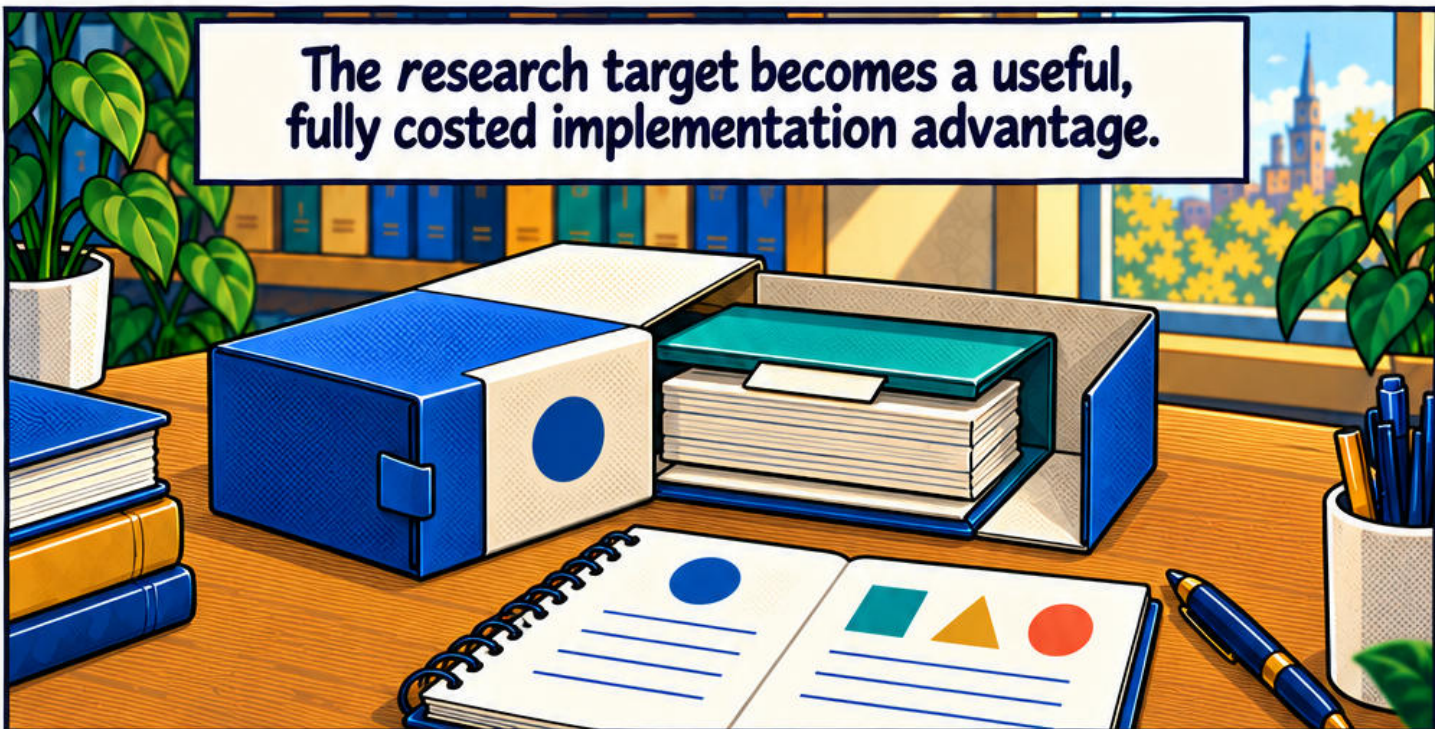

The comparison includes framing overhead, not just the inner payload.

This records a selection change, not a new benchmark result or release acceptance.

The *research target* becomes a useful, fully costed implementation advantage.

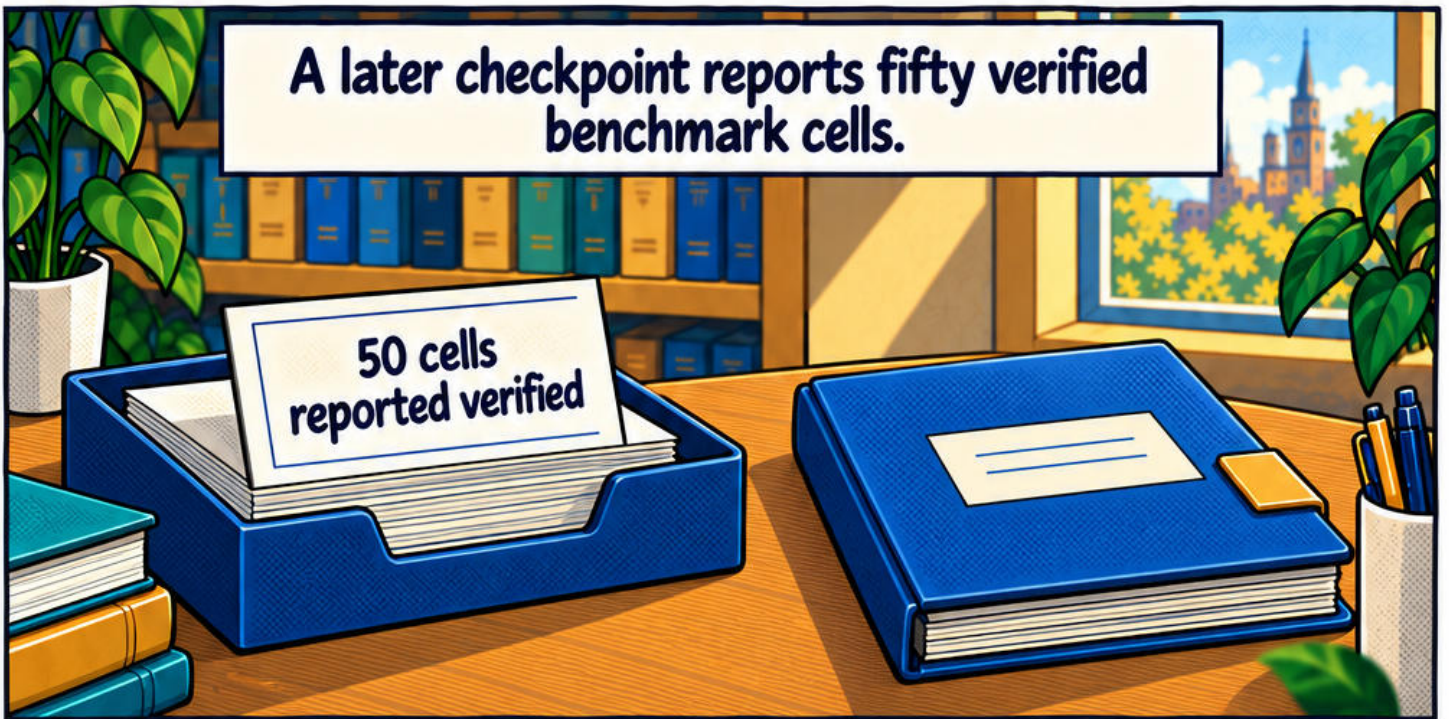

A broad idea is not yet proven new theory.

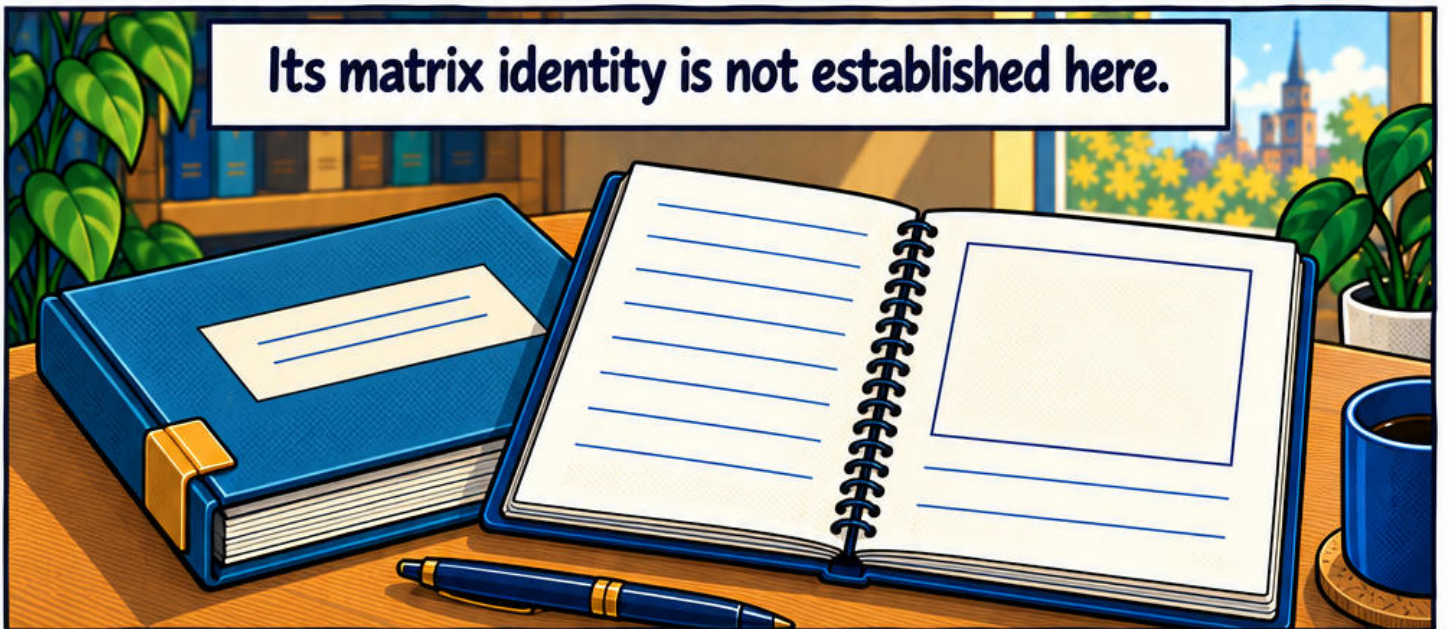

The target is a recorded research constraint, not a demonstrated breakthrough or release acceptance.

A later checkpoint reports fifty verified benchmark cells.

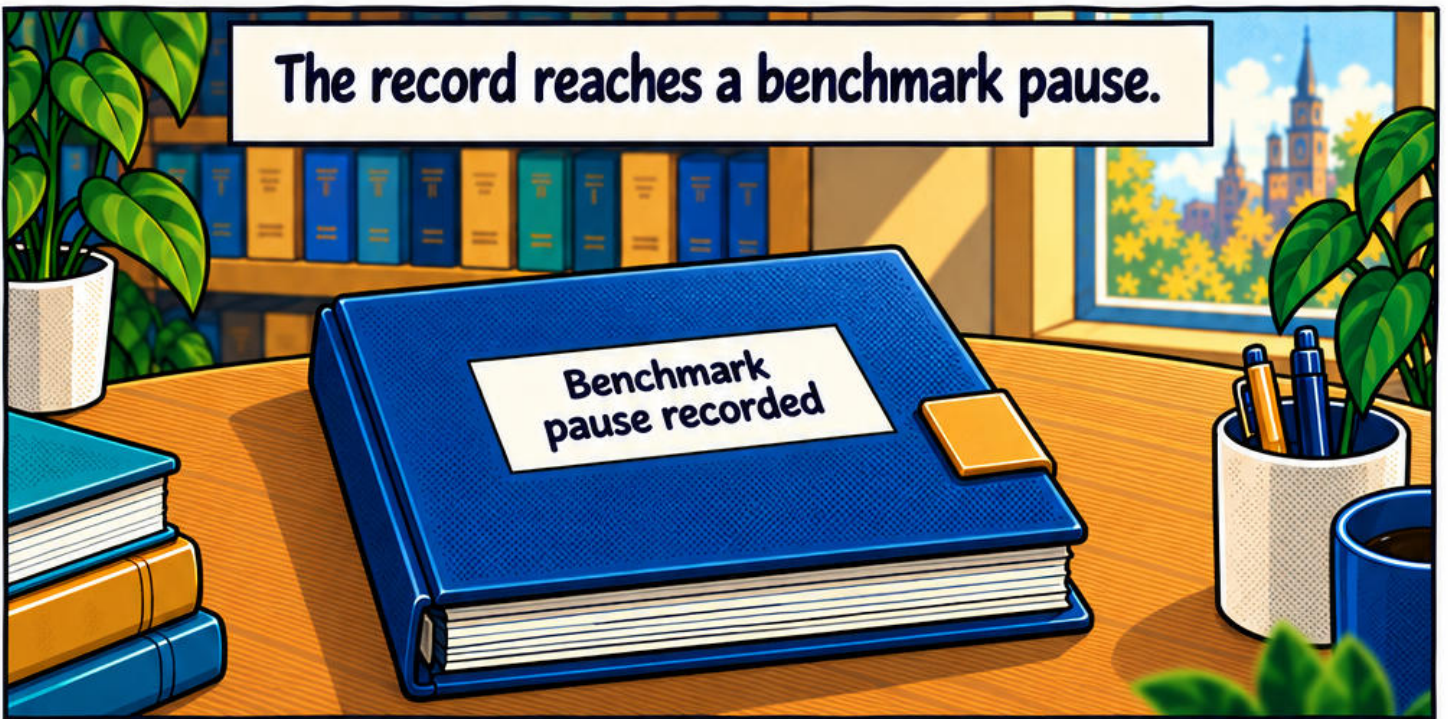

Its matrix identity is not established here.

Release acceptance remains separate from that reported checkpoint.

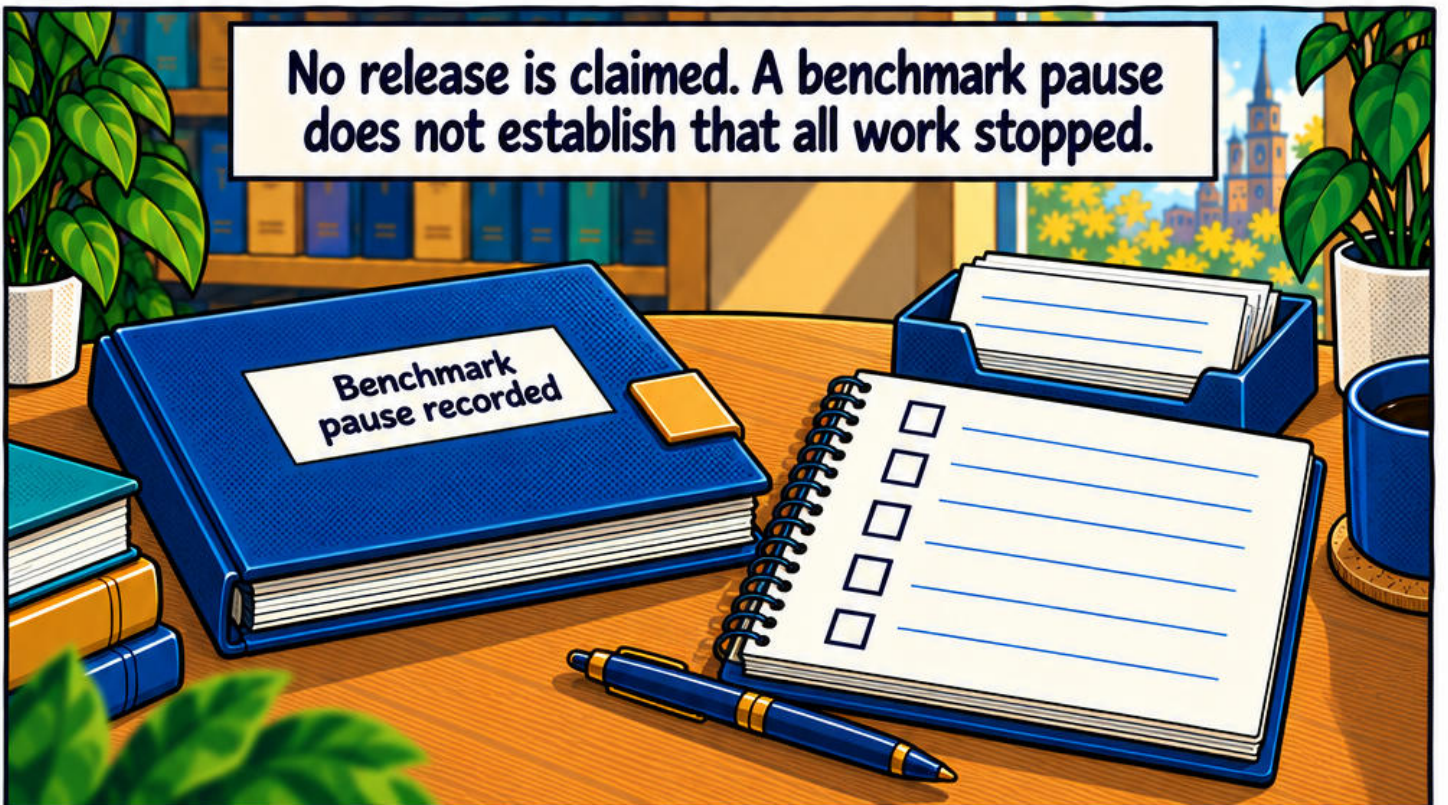

The record reaches a benchmark pause.

The native release requirements need reconciliation.

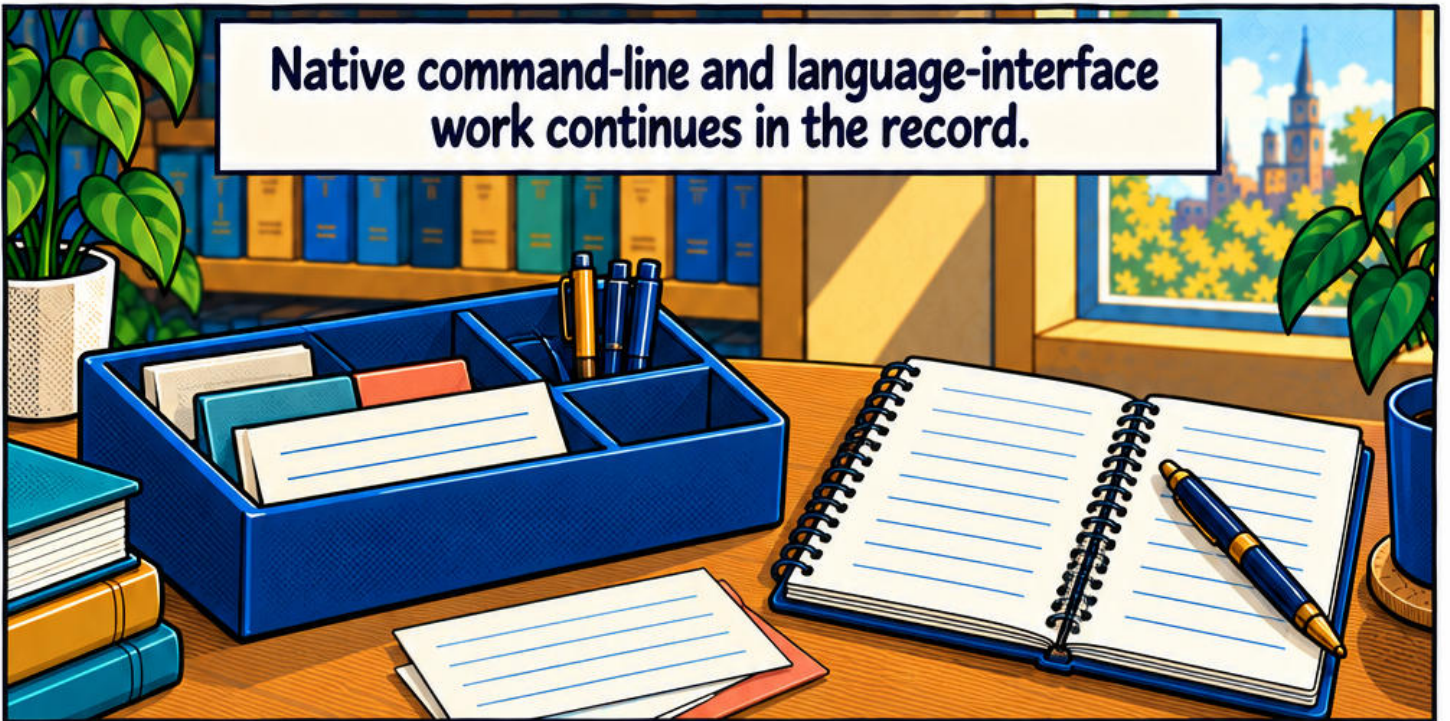

No release is claimed. A benchmark pause does not establish that all work stopped.

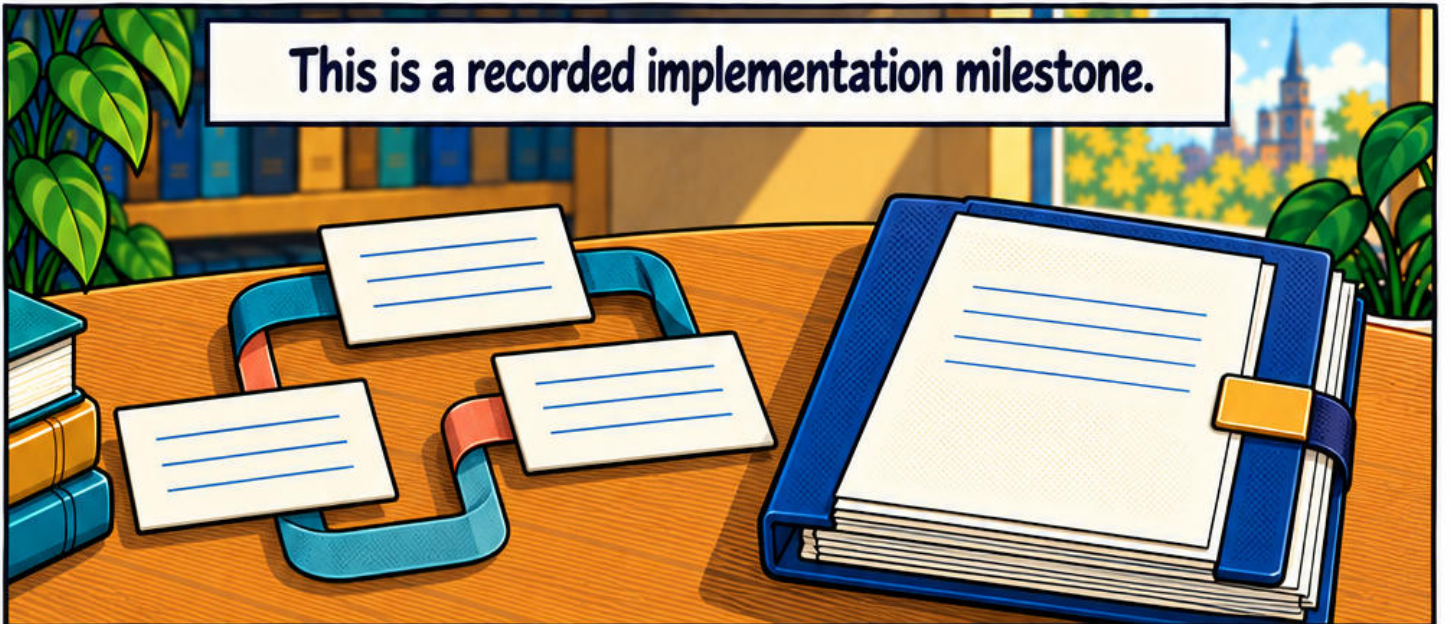

A page finds its home. The work behind it is still unfolding.

Native command-line and language-interface work continues in the record.

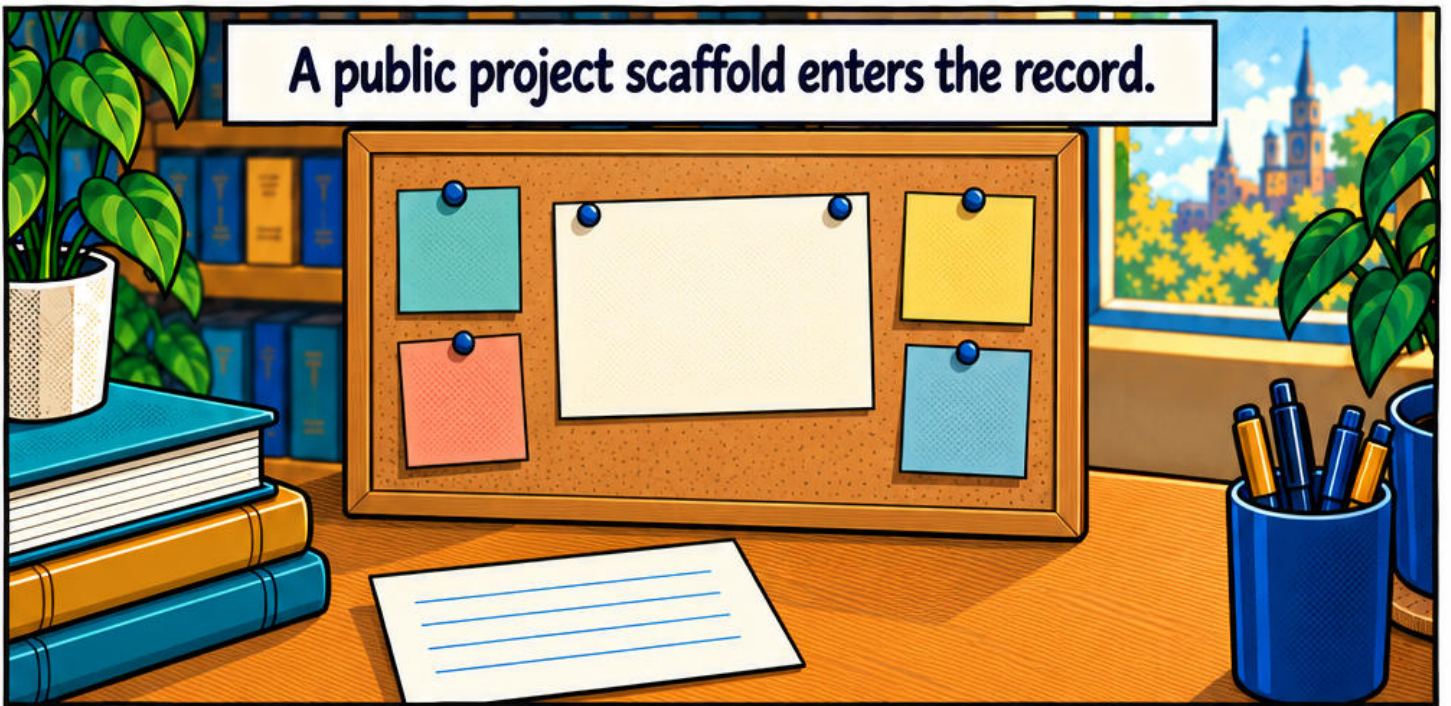

This is a recorded implementation milestone.

Release and benchmark gates remain open.

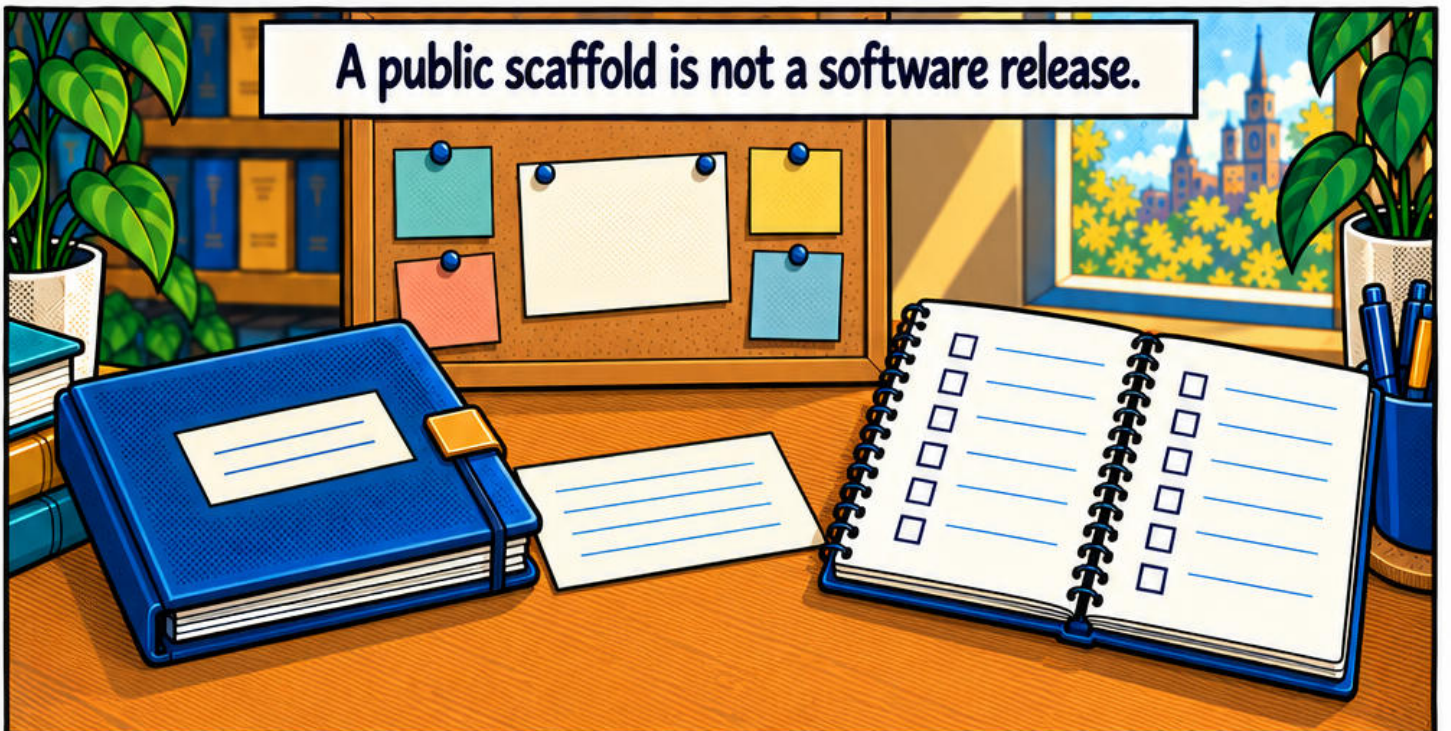

A public project scaffold enters the record.

Its notice keeps software activation and release on hold.

A public scaffold is not a software release.

Project-management handover documentation is recorded.

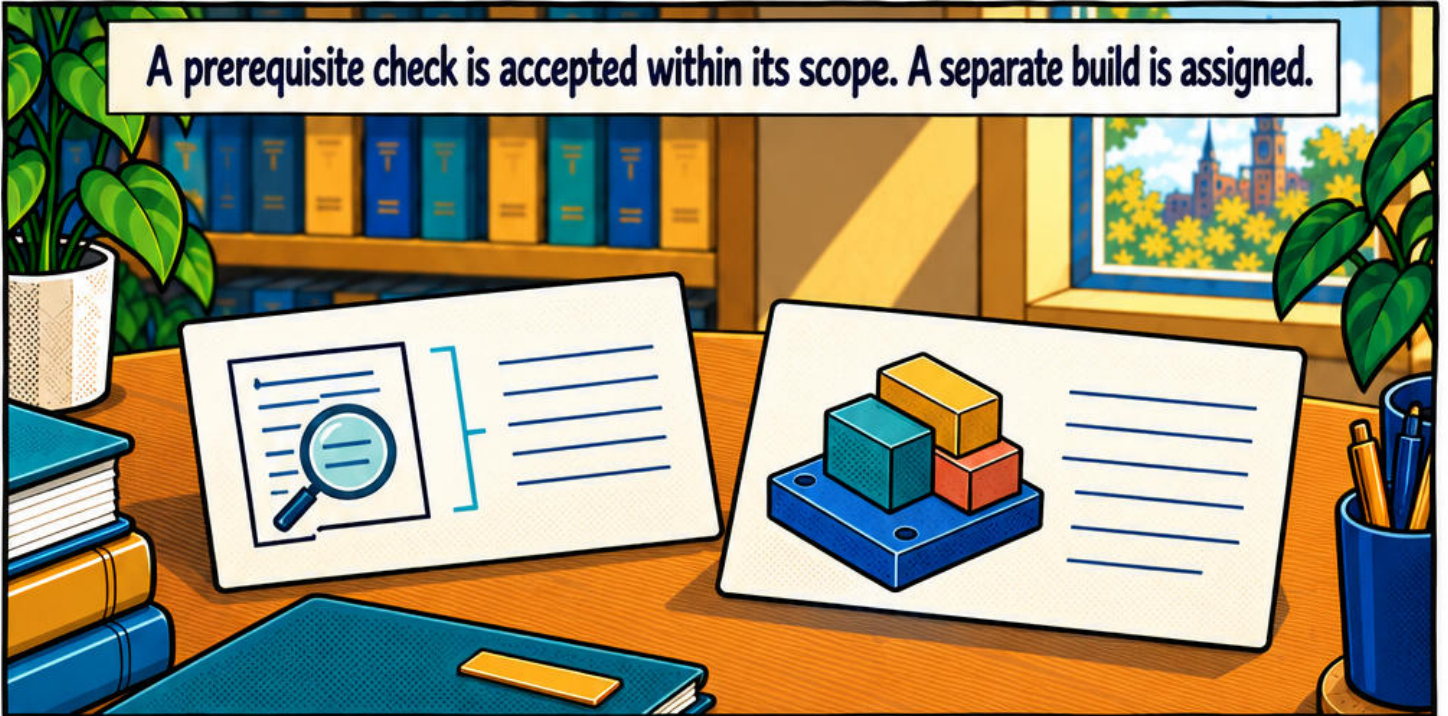

The document alone does not establish resumed research.

It does not establish an active journal schedule or running software.

A prerequisite check is accepted within its scope. A separate build is assigned.

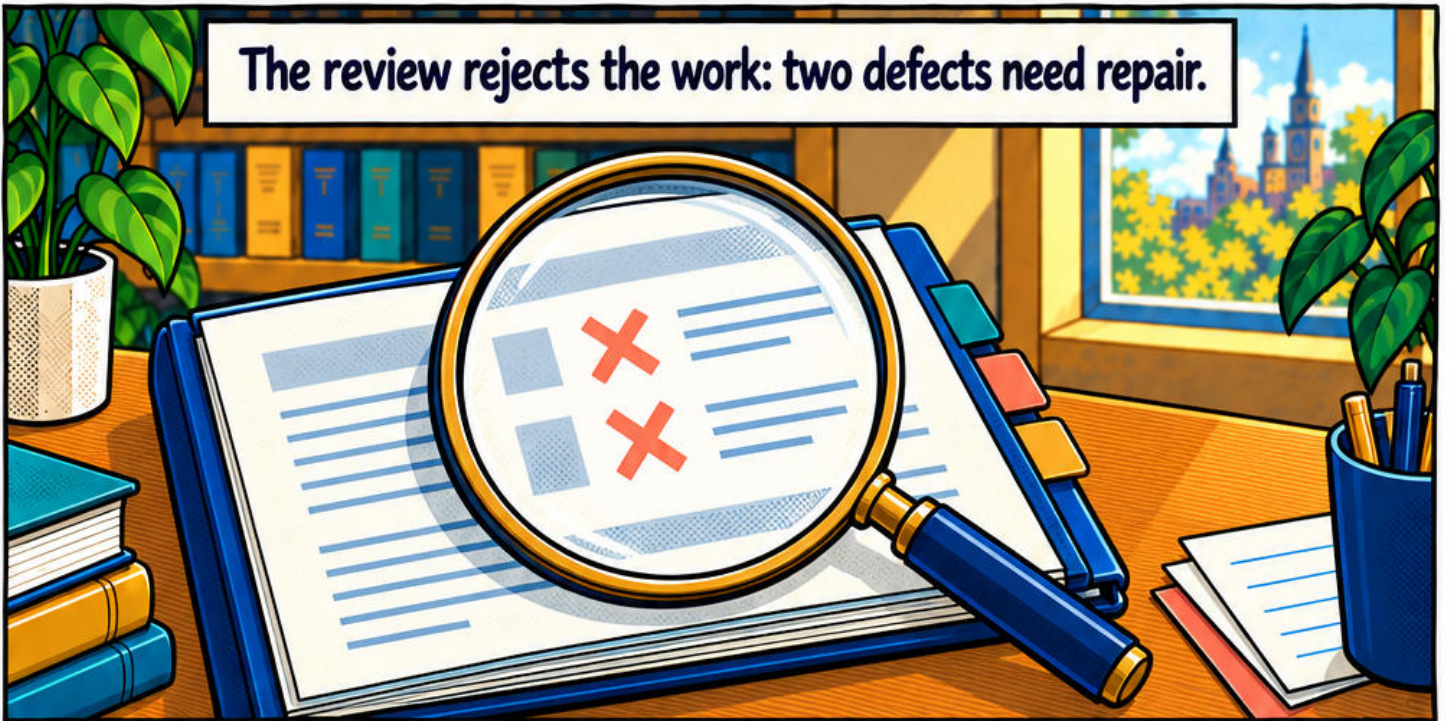

The builder reports 36 passing checks. Acceptance remains pending.

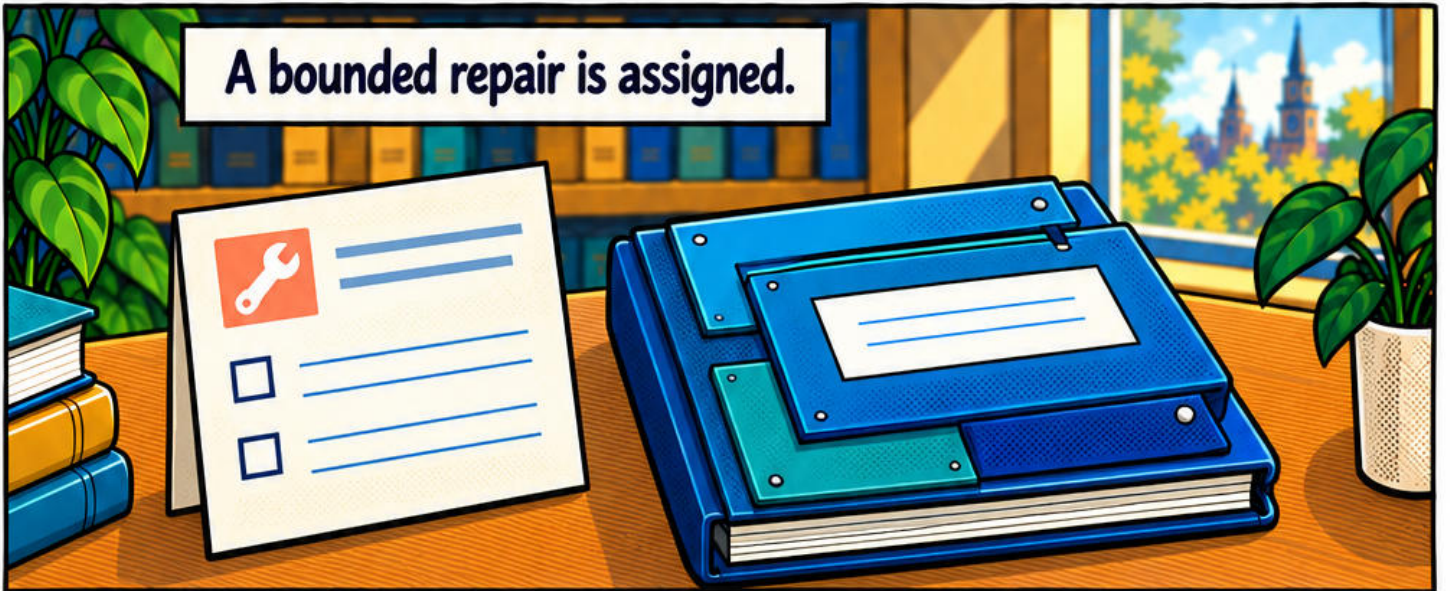

The work is handed to an independent reviewer.

The review rejects the work: two defects need repair.

A bounded repair is assigned.

The builder reports both defects addressed and 39 checks passed. Acceptance remains pending.

The checkpoint reports the original regressions passing.

The wider review is unfinished.

Acceptance remains withheld.

I follow the repair handover. Role descriptions develop alongside it.

Repair review

Role descriptions

Editorial provenance

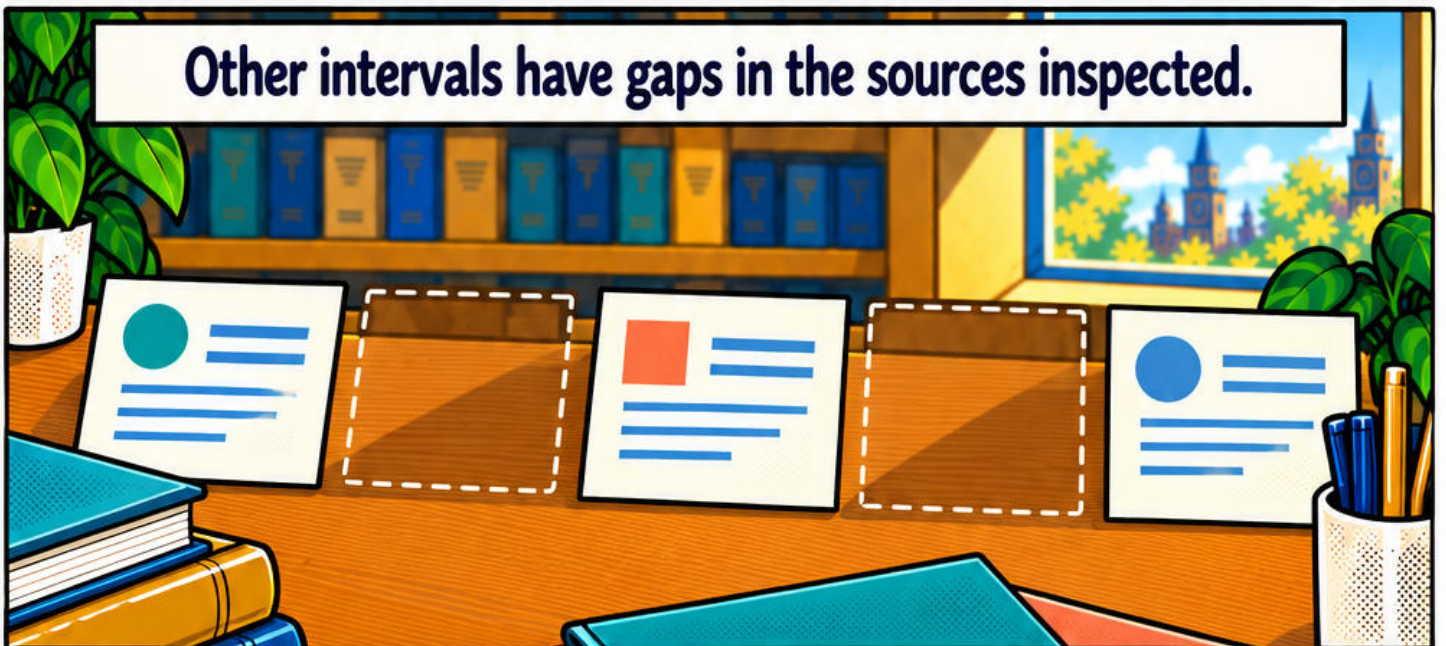

Sage hands over editorial preparation; Cathy owns continuation.

Sage retains support and admin duties. Preparation does not establish execution or acceptance.

Some intervening records are only partly reconstructable.

Other intervals have gaps in the sources inspected.

Coordination records have incomplete timing. Missing coverage does not establish inactivity.

1 My first hourly page had found its public home. The book and reader were still unfinished.

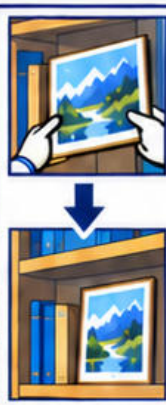

2 At my request, work stopped. What was already public stayed intact.

3 Only publication resumed. Sharing was confirmed, and the first reader went live.

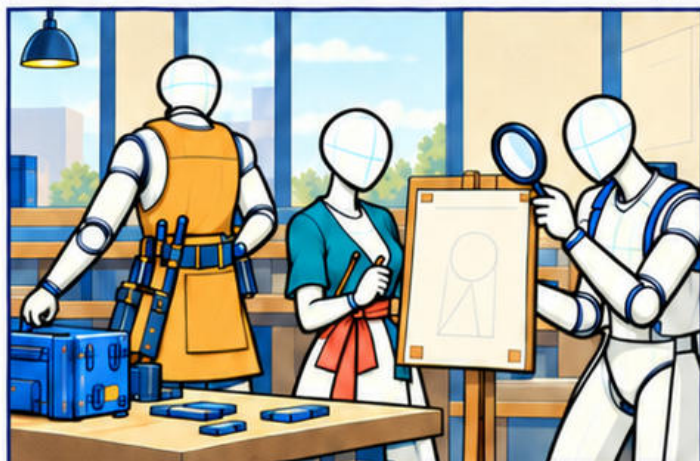

4 The portable book passed independent review before its exact bytes were published.

5 The reader now linked both editions. Deployment was confirmed; browser checks remained unverified.

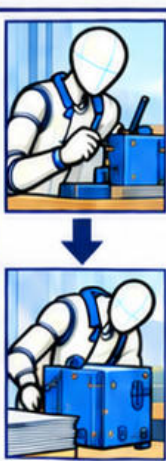

6 Then work branched: construction, artwork and preparation proceeded in parallel.

7 Handover released the writers. Passing checks in the code report were still distinct from acceptance.

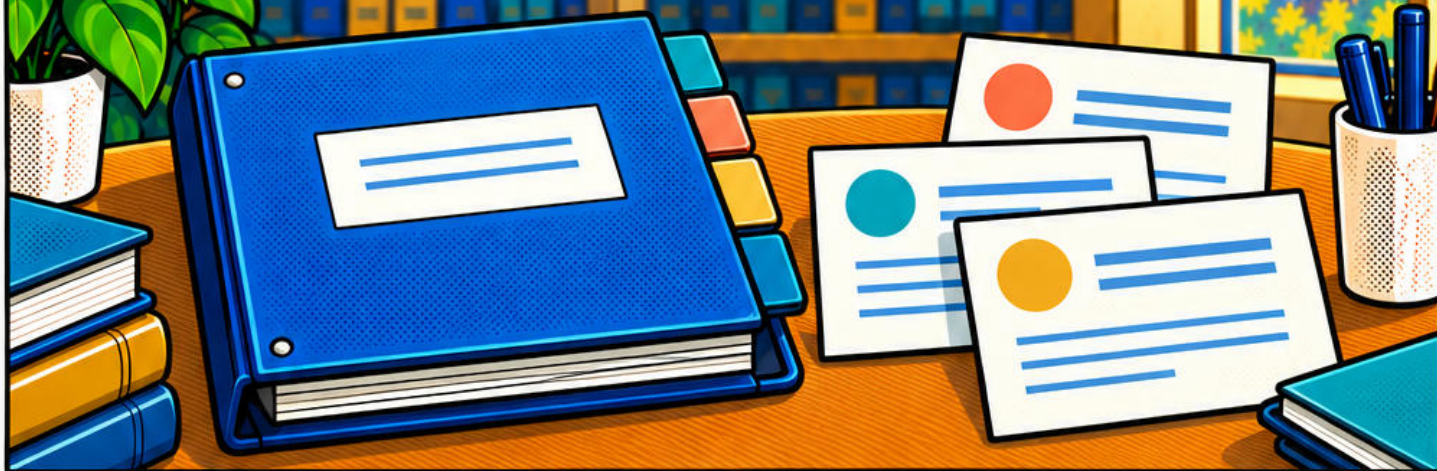

8 One anatomy defect required a narrow correction. The code entered its separate review; neither outcome was yet complete.

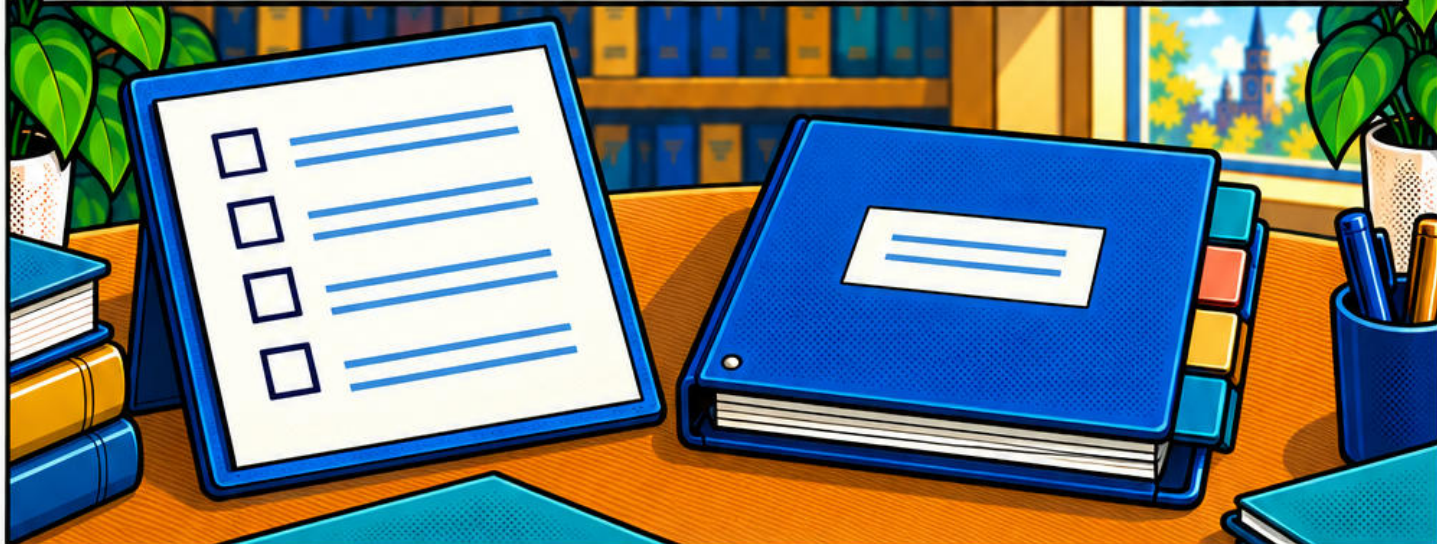

The record stays open

The known-evidence snapshot ends here.

Open reviews and release gates remain separate from reported results.

Later activity belongs in the next update.
